ABSTRACT

Introduction: This study was carried out to determine the extent of prostitution and its causes among Iranian children at risk of social harm.

Methods: The authoritative websites on the topic of childhood prostitution performed in Iran during the period 1985 to 2019 were searched in WHO, UNFPA, UNDP, WOS, ProQuest, Medline, Scopus, CINAHL, and Google Scholar databases for reviewing studies conducted in Iran. Articles from internal dissertations and Google's databases, SID, Magiran, Google Scholar, Iran Medex and IranDoc search engines.

Results: The search yielded a total of 1256 records. After removing duplicates, 45 documents were retained for further examination. After screening the titles and abstracts, seven papers were retained for full-text review. Two major reasons for prostitution were financial goals and sexual deviations that Including: running away from home, sexual harassment, forced sex, presence of a child among prostitutes including family members or friends, and other reasons including the history of addiction of parents, the history of detention and imprisonment before prostitution and the responsibility of supplying them (sponsorship) gifts and prices, membership in sex offending gangs, sex trade, and sex sales.

Conclusion: Violence, sexual abuse, and sexually transmitted infections, pregnancy, mental illness, involvement in child trafficking networks and substance abuse are the consequence of the experiences of these children in prostitution, therefore, it is very important that specialists and authorities should first consider heavy penalties for adults seeking sexual contact with children and key measures should be taken for the use of these children by social services.

Introduction

In the world, many children are involved in prostitution annually, and many of them are at risk of infectious diseases, getting pregnant, mental illness, substance

abuse, and violence (1). It has been reported that all over the world, child prostitution is a common problem in Central and South America and Asia (2). In Iran, the rate of

child prostitution has increased dramatically in recent decades. Ranging from 2.9% in the 1960s to 17.4% in 1970s and 78.3% in 1980s to 1990s (3). Child prostitution like other forms of child sexual abuse, and especially, if it becomes a business activity, does not only cause the death of millions of children, but it is a gross violation of children's rights in both developed and developing countries (1,2,4). In the convention of the children's rights (UN, 1989), the child is referred to any person who is under the age of 18 years, and children's prostitution means children who are forced into prostitution because the child has no choice and complete knowledge of sexual activity to choose this activity (as a job or service or exchange) (3).

The reasons for prostitution and the social environment are different. Sexual abuse and rape are considered to be frequent childhood events that most children experience before starting prostitution (4). Other important and frequent events are also seen in the life of children prostituting. Early separation of parents, patterns of child care, an unwanted marriage, poverty, drug and alcohol abuse, friends or family members who are involved in prostitution, physical and emotional abuse, homelessness and early delinquency are among the main factors behind child participation in prostitution (5,6). The degree of relationship between child and family members or friends who are involved in prostitution is very important in continuing or reducing this behavior (5). Because any struggle or conflict that separates adolescents from the family makes them very vulnerable (7).

Although these children volunteer to enter into sexual activity, the handling of such practices leads to some complications such as a decrease in the quality of life, a disruption in social relationships, low utility of daily activities, and self-destructive behaviors (8).

As stated by the researchers, this study is the first systematic and meta-analytic review study in Iran to determine the rate of prostitution and its implications in this

country. Health professionals and social workers through the identification of protective factor can help children who are involved in prostitution. They can also help the government and non-governmental organizations who are involved in this process to make policies and laws to prevent child prostitution and its effects on the children's health.

Methods

This study is a review of child prostitution in Iran, thus, focusing on reasons for prostitution in Iranian children

Search strategy

There are authoritative websites on the topic of children's sex trade in Iran, including the WHO, UNFPA, UNDP, WOS, ProQuest, Medline, Scopus, CINAHL, and Google Scholar databases for reviewing studies conducted in Iran. Articles from internal dissertations and Google's databases, SID, Magiran, Google Scholar, Iran Medex and Iran Doc during the period 1985 to September 2019 were included. The list of published articles sources was also reviewed for further studies. Also, editors of internal journals were interviewed to find grey papers. The keyword combinations were accepted with AND/OR. Search and extraction of data was done by two people independently.

English keywords were used to search for articles in prostitution

Prostitution, sex working, children, youth, teenagers, teen, child, prevalence, Iran.

In addition, the Persian equivalent of these words was used in the search.

Qualitative assessment and study selection

At this stage, all articles in the title or abstract (without time limit) with the mentioned keywords were included, they entered the initial list. All the irrelevant articles were deleted and based on this; they seek a qualitative evaluation of the list of articles in the secondary search.

After the relevant articles have been determined, they were reviewed by the STROBE checklist for title and content overview (9). Questions that deal with different aspects of the method of work, including the necessary study data, such as the title of the article, the study location, study time, sample size, average age of the patients, the type of sampling, and the overall prevalence of prostitution in girls and boys, The reasons for the trend to prostitution, child labor and child street are covered. In order to evaluate the final article, a score was awarded to each question. Any article that earned eight points of scores could enter the statistical analysis step.

Data extraction

Information by two blind researchers in the form of the article title, the first author, year of research, sample size, age, and outbreak

in prodex was included in the Excel program.

Eligible entries to study

After the assessment process and obtaining the necessary grades, all Persian and English studies that examined the prevalence of prostitution in Iranian children were included in the study.

-Noneligible entries to study: All incomplete and irrelevant articles that were received and after reviewing the title, abstract and full text, and after qualitative assessment of the score below eight, were excluded.

Results

Finally, seven articles entered the meta-analysis process (*Figure 1* and *Table 1* and *2*). The search yielded a total of 1256 records. After removing duplicates, 45

Ardalan et al. (2002) (16)	Tehran	Descriptive	110 (100)	High	Sex distribution is not good

documents were retained for further examination. After screening the titles and abstracts, seven papers were retained for full-text review. Based on pre-defined inclusion criteria, seven records were included in the systemic review.

Prostitution for sexual deviance

In 2010, Madani Ghahfarqi and colleagues conducted a study in which women in the 22 areas of Tehran were questioned about their manners, beliefs and attitudes. Each unit of the sample was selected by using Clustering sampling method. More than 40 percent of these prostituted children have been born in a city other than Tehran, possibly migrating to the metropolis later. 55% of them had middle and upper secondary education. 21% of them, in addition to prostitution, had jobs such as secretaries, hairdressers, workers, salesmen, service businesses and black jobs. 67.6% of them lived with their parents when

they started prostitution, and the rest were only friends or alone. 37.5% of them at the starting of prostitution was illiterate, 66% have addicted fathers, 33% of their fathers were sentenced offenders, and 20% of children had addicted mothers. 7.7% of their mothers were also prostitutes (3) (**Table 3**).

In the study of Mahdizadeh thesis for obtaining a Master's degree in social work, conducted in 2002 in Mashhad, Out of all street children living in the city's Sadaf center, 227 subjects were selected randomly. About one third of non-traditional Iranian children in Mashhad, Migrants from the provinces of Tehran, Ahvaz, Sistan and Baluchestan and Shiraz. Approximately 56% of these children aged 9 to 13 were leaving home due to parents' incompatibilities, especially the father's mistreat. Most of them was illiterate or low-educated children particularly in primary level (80%). 86% of these children lived alone in the streets,

squares, single houses, and Bundy houses before they lived in maintenance centers. 14% of these children had a history of imprisonment and imprisonment, juvenile penitentiaries and rehabilitation centers, Which resulted in 50% of the imprisonment in these children, robbery and robbery, and others in sexual gangs and deviations. Currently, 92% of these children were supported by the Welfare Organization and the Supported by the Charities (11) (**Table 3**).

Prostitution for financial goals

In 2010, a study was conducted on 1000 street children in a Tehran study on the behavioral biology of street children and children in Tehran related to AIDS infection. Findings of the study showed that 291 (29.1%) of them had sexual intercourse, and about 83 had used condom in their last sex. 17.1% of children mentioned the age of their first sexual desire below ten years of age. 38.1 out of 41 (11.6%) of those the first time sex was beyond the family framework, 29.3% with non-homosexuality, and 70.7%

were homosexual. 22.4% of these children never went to school, 83.9% of these children lived with the family, And the rest of the night they spent in single houses or semi-detached houses or at work. 20.7% of them had a history of police arrest. Concerning the prevalence of prostitution in these children, Thousands of sample size, Only 21 people answered this question, and of these 21 people, the response of 9 people (38.1%) was positive (12) (**Table 3**).

In a systematic review of street children studies conducted in 2010 as part of research results "systematic reviews related to social determinants based on the WHO model in Iran" Was carried out by Vamaghi et al., in a survey of one study, the prevalence of prostitution (as a job for a child to earn money) was reported at 2.3% (13) (**Table 3**). Foroughi et al. study titled "Prevalence of HIV, HBV and HCV among street and labour children in Tehran, Iran". Time-location sample method was used. Thousand street and labor children (aged 10–18 years) were recruited street and labour children. Data collection tools were semi-structured

questionnaires. 57.4% had dropped out school and 17.2% had never attended any formal educational programme. When street children was asked whether "Had she/he experience of commercial sex. 12 (9.2%) replied "yes" in HIV positive and 119 (90.8%) in HIV negative. 33 (3.8%) replied "no" in HIV positive and 836 (96.2) in HIV negative) (14) (*Table 3*).

In a study aimed at examining the increase in the number of street children, Saliho (1999) identified 3725 street children in Tehran using a targeted snowball sampling method. The results of his study showed that street children in Iran face many challenges such as extortion, exploitation, abuse, and harassment (15) (*Table 3*).

Ardalan et al. (2003) conducted a study to examine the phenomenon of runaway girls showing that half of the participants had an experience of sexual relationship for survival to gain money and seek shelter in the first days of running away. Out of these relationships, 25 cases led to pregnancy. A number of them had an abortion under unsafe conditions or provided by someone without medical training. The reason they mentioned why they did not refer to hospitals was fear of being captured and lack of money (16) (*Table 3*).

Discussion

As far as the researchers are concerned, this

study is the first systematic review study in Iran to determine the extent of prostitution and its causes in the country. Commercial sexual exploitation of children (CSEC) happens in four forms: child prostitution, child pornography, child sex tourism, and child trafficking for sexual exploitation (17). In this definition, children have sex with adults in return for rewards or any other benefits such as the satisfaction of their basic needs such as food, shelter, and protection or advantages such as getting a higher score or additional money (18).

Although it is not guaranteed that all those who have suffered from child sexual abuse will sell in the future, in this study, sexual abuse and sexual assault were identified as the most common childhood incident that most children experience before they began to trade and most of them lived with their families during the time of the sexual abuse. This study is in agreement with the research of Hounmenou (2016, 2017) (4,6). So, this is a very important case of the common events in the lives of girls and boys at the beginning of prostitution and parents should pay close attention to this matter. Also, indirectly, they should be sure of the moral integrity of the networks of friends who are in contact with their children, to the extent that connections to the network of friends will not conflict with the values and norms of the child's family.

Since violence, sexual abuse, and sexually

Table 3. The reasons for prostitution in Iranian children

Ardalan et al. (2002) (16)	Safety after scape, Financial goals

transmitted infections and AIDS, pregnancy, mental illness, involvement in children's trafficking networks, the imprisonment of the child, rape, coercion of the child for prostitution, and the substance abuse is the consequence of the experiences of these children in prostitution, therefore, specialists and authorities must first consider heavy penalties for adults seeking sexual contact with children, and secondly, key measures should be taken for the use of these children by appropriate social services and educational programs on access to health services and preventing the transmission of these infections to a variety of others as well as preventing the onset of smoking and drug abuse (19-21). Giving grants to non-governmental organizations is beneficial in supporting these children. These centers can provide counseling, social working and support services, training programs and professional training programs to reduce the risk of family planning and prevention of illness in these children and their families are an important step in reintegrating the child into the community, family, and labor market (22,23).

In any community, cultural norms and traditions play an important role in family members', particularly young girls' loyalty and commitment (24). Furthermore, welfare in the family is also an influential factor in creating commitment. The results of the present study showed that many children turn to prostitution for different reasons, such as poverty and to ensure relative well-being. They not only need financial support but have to provide financial support for their parents and relatives as well. Among these factors, poverty is the leading cause of forcing children toward prostitution. Therefore, it can be concluded that economic development is often beneficial to the community and can put an end to the prostitution of children from low-class families (24, 25). However, based on the findings, the importance of the income from child prostitution can be focused upon when developing alternative interventional programs for children, including the

development of high-income activities in prostitution (18).

Limitations

There are limited researches on prostitution and sex trading in Iran, especially as children are dependent on it. Since these people have nothing to do with health facilities or well-being centers, one cannot cite the exact figures in this regard. Also, given the severe limitations of researches in this field, it cannot be said that in recent years, if the trend in Iran is rising or decreasing. Other obstacles to the implementation of this systematic review and meta-analysis are the small sample size, the lack of response of some subjects to the questions of prostitution and not to consider the gender of children, and unclear reason for prostitution due to other details including forced marriage of children, extremes in the parenting model (authoritarian or permissive), lack of emotional communication between family members, collapsed families (emotional and legal divorce), the issue of custody of the child during separation, contrary to their desire and expediency (the necessity of father and daughter's guardianship) and parental incompatibility, immigration, physical and psychological violence of the child after the determination of the child's prostitution by family members and the economic difficulties of the family (26), which is recommended to be considered in subsequent studies in Iran.

Suggestions for future research

The most important strategies of the WHO based on the WHO educational module in health policy approaches in these children are to modify their attitudes and motivate them to correct their behavior in the following areas, which are recommended to be institutionalized by authorities and specialists in Iran:

- 1- Preventing substance abuse by identifying the effects and complications of using these substances

- 2- Health and fertility and sexual activity in these children: Include training on the use of a condom for any sex, reducing the number of sexual partners, and avoiding sex when the child has an open wound or sexually transmitted disease. Also, contraception education and complications of unwanted pregnancy and abortion are important issues.
- 3- Child support Programs: Child support and welfare systems include a range of services (e.g. family-based services, child support, out-of-home services, and reception services), prevention, and intervention and treatment support (27,28).

Conclusion

The phenomenon of child trafficking does not only affect the child but also jeopardizes the health of the community. In order to develop children's health policies and programs in the country, it is necessary to provide appropriate services.

Acknowledgment
